

CONTAINS 4 SOCKETS AND REMOTE CONTROL

Product Specifications

- Power rating 13A, 240V
- 2,400 watts max. load
- Transmission frequency 433.92 Mhz
- 12V DC battery in remote control (included)
- Manual on/off button
- Power on indicator light
- 20 metre range between transmitter and the receiver in a straight line
- Multi-channel assignment for each socket
- Less than 0.25W power consumption for the control socket when turned off
- Can be used with a connected power board
- Works through walls and ceilings

Save Energy. Save Money.

Easy-Off Sockets x 4

Ensure your PC, TV, lamps and AV equipment are turned off completely, not left in standby mode.

Each year we have more and more computers, TV's, Hi Fi equipment, and other equipment around the home and office. **All this is great but it pushes our energy costs up and up. The more of these types of products we have the more we leave equipment in standby mode. The electricity used whilst in standby mode can add up to significant amounts across weeks, months and years. Often we just leave our items switched on or in standby mode; this is costing us a lot of money and a needless use of energy. In addition to this, leaving our equipment turned on shortens the life of the product and also increases the fire risk etc.**

The Easy-Off Sockets comes with 4 sockets and a remote control which helps residents and companies to ensure that they turn all relevant equipment fully off.

The Easy-Off Sockets are a very simple way of turning off equipment and appliances. It can be used to turn off just a single appliance, or it can be used with a power board to control multiple devices from a single remote control socket.

The product works with radio frequency transmission so will work through walls and unlike IR does not require line of site to operate correctly.

How It Works

AUSTRALIAN FIRST – PLUG AND PLAY FEATURE. For the first time ever there is no need to program the remote control. **Simple plug in and start saving!**

The Easy-Off Sockets x 4 allows you to turn the power to your appliances and equipment on and off by remote control. You can do this from a distance by simply pressing a button. No excuses anymore for not turning off the TV, Hi Fi, lamps etc.

Once turned off they will use no electricity, so no more standby energy is wasted. The unit itself uses a very small amount of electricity to power the PCB board inside.

You can add additional sockets with the same remote control. You can control more than one socket with the same button. It will work through walls and ceilings. Additionally you can connect any standard power board to the socket.
